## VOLUMETRIC DRAIN FOAM

### A Natural Way to Clean Drains

MICROBEMAX Volumetric Drain Foam eliminates FOGs (fats, oils and grease), and breeding sites for drain flies and fruit flies through a natural process called bioremediation – the use of biological organisms such as plants or microbes to aid in removing unwanted organic substances from an area. Clean your drains easily, efficiently and naturally. Increase revenues by offering an innovative, proven and effective way to service drains. Help our environment using a green formulation consisting of millions of natural bacteria that consume and eliminate FOGs without the use of harsh chemicals or bleaches. MICROBEMAX Volumetric Drain Foam will dramatically improve your drains, bottom line, and because it is 100% green, our environment.

#### MICROBEMAX Unique Three-Step Drain Treatment Process

##### Step 1. Immediate Knock-Down Effect

MICROBEMAX thick foam provides an immediate protective shield that prevents any pests from exiting the drain. One can of MICROBEMAX can treat up to seven drains with a gallon of rich lather. Pests get caught in the foam and P-Trap, or are chased out of the pipe through the sewer or grease trap system, away from your facility.

##### Step 2. Organic Material Breakdown

Once in the drain, MICROBEMAX environmentally-safe surfactants (equivalent to naturally-occurring soaps), breakdown pest breeding and harborage areas. Organic material such as food residue or cooking ingredients are broken down and later washed away when the drain is back in use, reducing the areas where pests can live and multiply.

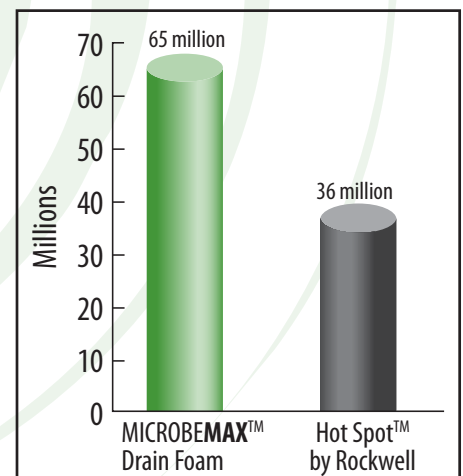

##### Step 3. Bioremedial Cleaning Effect

Finally, MICROBEMAX microbes eat the remaining organic material, completing the elimination of the pest breeding and harborage areas. This bioremedial cleaning effect is Nature’s way of breaking down the remaining organic material and converting it into fish food and water. MICROBEMAX’s millions of multiplying microbes leave the drains cleaner and eliminate the source for pests like flies and cockroaches, naturally.

*“We used MICROBEMAX Volumetric Drain Foam for a very sensitive new hospital account. Many areas, including the kitchen, had a severe drain fly and fruit fly problem. Previously we would lug un-practical, heavy foam equipment through the building so it was a relief to everyone when we starting using the Volumetric Drain Foam 20oz can – which has been extremely effective and convenient to use. We think this is just the thing to allow our technicians the ability to upgrade accounts easily and vastly improve drain cleaning.”*

*Stan Dawkins Jr., Director of Operations  
Eden Advanced Pest Technologies*

*When compared with similar drain products 48 hours after application, the amount of bacteria in MICROBEMAX Volumetric Drain Foam is almost twice as high as the next leading product.*
